1 Easy customization of PDF export in org-mode

org-mode provides simple export to PDF via L^AT_EX, but the layout of the document is not that sophisticated and is based on the regular article class. Let us examine some methods to get an extremely lightweight export of a heading in an org-file. We want to avoid setting things like `#+LATEX_CLASS`, because that is not *light-weight*. We want a simple command to run that exports for us. The solution will involve some emacs-lisp code to do the export and build, and some variable configuration.

- references, from `reftex-default-bibliography` if not otherwise specified
- Use heading for title, and file name

testing

`=./test.pdf =+begin_example`
